

# How to Integrate a Model into the AMT

Hot Topic 8

Roberto Barumerli and Piotr Majdak

EEA Summer School  
Torino – 2023/09/08

[roberto.barumerli@oeaw.ac.at](mailto:roberto.barumerli@oeaw.ac.at)

# Content

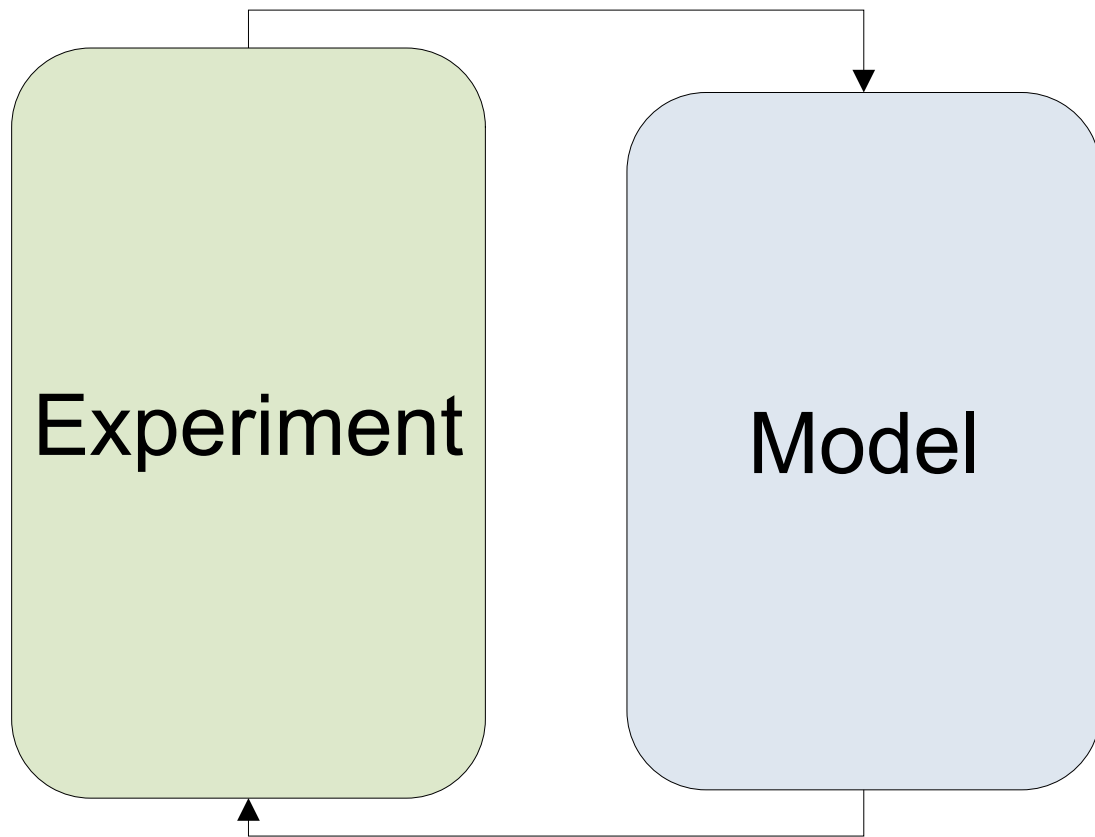

- Question: How do I integrate my experiments or models into the AMT?
- We will cover:
  - AMT's folder structure
  - Model's anatomy
  - Coding conventions and guidelines within the AMT

# Folder structure

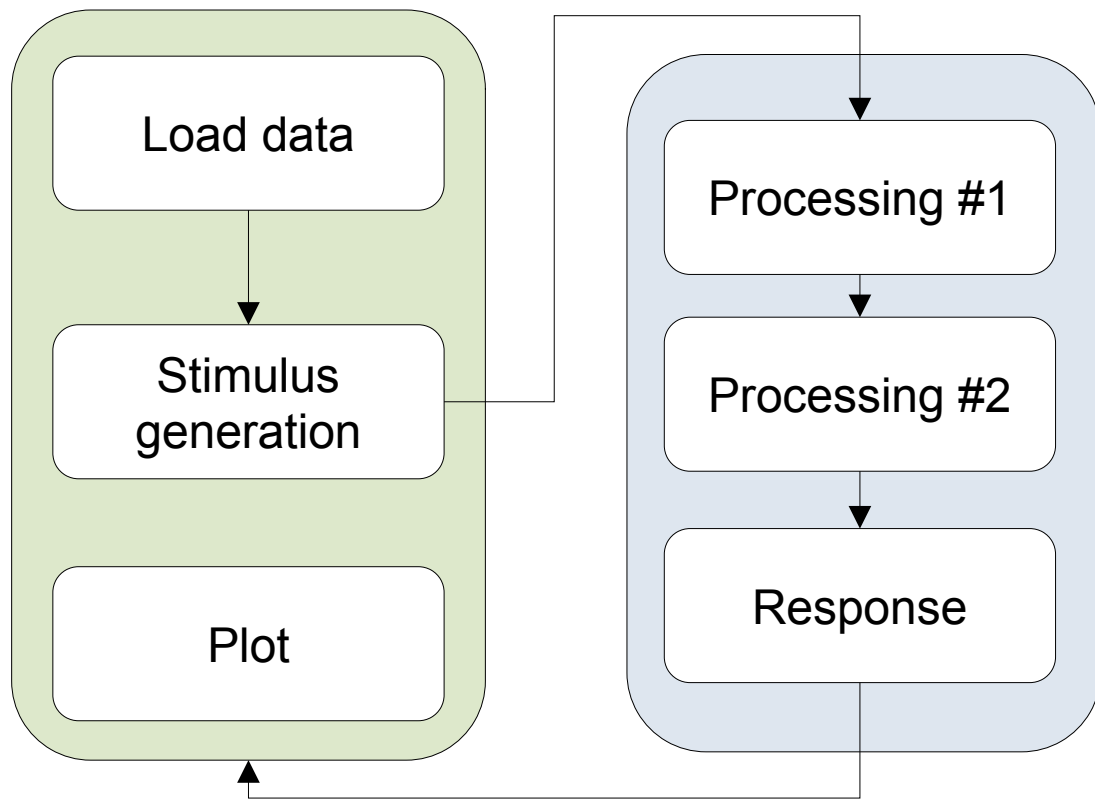

- **common**: useful functions for hearing related computations.
- **data**: experimental data from several studies.
- **defaults**: definition of parameters and flags and their default values.
- **demos**: scripts show-casing the basic functionalities of a model.
- **experiments**: code to compute model's results that made it into a paper.
- **models**: here we have the models!
- **modelstages**: models may contain multiple processing steps. This folder is dedicated to break down the structure in separate scripts.
- **plots**: code to generate complex visualizations.
- **signals**: scripts to generate generic or specific signals.
- **thirdparty**: external toolboxes like SOFA API or LTFAT.

# How to contribute

- We ask for:
  - Model: <surname><year> (and modelstages...).
  - Experiment: each model needs an experiment file (exp\_<surname><year>).
  - Documentation: at the beginning of each script following the conventions.
  - Demo: showcase of the model functionalities (demo\_<surname><year>).
- If required:
  - Local functions prefixed with 'local\_'.
  - Long calculations cached with amt\_cache.
  - Binary data loaded with amt\_load.
  - Text printed with amt\_disp.
  - HRTFs stored as SOFA file.

## Model's header

```
function [out1, ..., outn] = <surname><year>(in1,..., inn, varargin)
%<surname><year> short description
%
% Usage: out1 = <surname><year>(in1,..., inn);
%       [out1, out2] = <surname><year>(in1,..., inn, varargin);
%
% Input parameters:
%       in1 : description of input 1
```

## Model's header

```
function [out1, ..., outN] = <surname><year>(in1,..., inN, varargin)
%<surname><year> short description
%
% Usage: out1 = <surname><year>(in1,..., inN);
% [out1, out2] = <surname><year>(in1,..., inN, varargin);
%
% Input parameters:
%     in1 : description of input 1
```

Everything matters

## The hands-on

- Integrate a sound localization experiment into the AMT
  - Generic script with an experiment provided
  - Integrate the script following the AMT conventions
- At the end of the task:
  - You will understand how to use AMT functionalities to implement your experiments and/or models.
  - You will know how to integrate your code into the AMT.
